

BRAKE-LAMP

Chandelier made from a
motorcycle brake discs

BRAKE-LAMP HOLDER

The BRAKE-LAMP chandelier was inspired by the finding in a scrapyard of several brake discs of scooter and motorbikes, with very dynamic and complex shapes. Starting from these shapes and their material structure, I looked for a use that would enhance their design. The chandelier is based and built around the disc's ventilation holes - which will serve as pass-through for the retention steel wires - and with the central hole being used to house the lamp. The chandelier supporting structure which hangs from the ceiling is made from a brake pad.
